-i- SUBCELLULAR LOCATION: Integral membrane protein (Probable).
-i- MISCELLANEOUS: This is one of the target of the anit-tubeculosis drug ethambutol [(S,S')-2,2'-(ethylenediinino)di-1-butanol; EMB] is a first-line drug used to treat tuberculosis. EMB inhibits the transfer of arabinogalactan into the cell wall.

RT "TGF-beta 1 binding protein: a component of the large latent complex

RT of TGF-beta 1 with multiple repeat sequences.";

RT Cell 61:1051-1061(1990).

RL Cell 61:1051-1061(1990).

RL Cell 61:1051-1061(1990).

RC C. SUBUNIT: THE LARGE LATENT COMPLEX OF TGF-BETA1 FROM PLATELETS IS

CC O. TENEOUSED OF THE TGF-BETA1 MOLECULE NONCOVALENTLY ASSOCIATED WITH

CC A DISULFIDE-BONDED COMPLEX OF A DIMER OF THE N-TERMINAL PROPEPTIDE

CC OF THE TGF-BETA1 -BP DOES NOT BIND DIRECTLY TO ACTIVE TGF-BETA1.

CC BETA1-BP TGF-BETA1-BP DOES NOT BIND DIRECTLY TO ACTIVE TGF-BETA1.

CC BETA1-BP TGF-BETA1-BP DOES NOT BIND DIRECTLY TO ACTIVE TGF-BETA1.

CC 1-1 ALTERNATIVE PRODUCTS: 2 isoforms; a short form (AC P22064) and a

CC 1009 form (shown here); are produced by alternative splicing.

CC 1-1 TISSUE SPECIFICITY: The long isoform is found in fibroblasts.

CC 1-2 TISSUE SPECIFICITY: The long isoform is found in fibroblasts.

CC 1-2 SIMILARITY: CONTAINS 16 EGF-LIKE DOMAINS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ASSOCIATED WITH DIFFERENTIATION IN BONE AND TESTIS.

-I- CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)O = protein tyrosine + phosphate,
tyrosine + phosphate,
tyrosine + phosphate,
-I- SUBCELULAR LOCATION: Type I membrane protein.
-I- ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; may be produced by alternative splicing. A presumed alternate transcript of 4.8-5.0 kilobases, which may lack PTP domains, is present in proliferating osteoblasts, but not detectable at other stages.
-I- TISSUE SPECIFICITY: BONE AND TESTIS. IN THE LATTER, RESTRICTED TO THE BASAL PORTION OF THE SEMINIFEROUS TUBULE.
-I- DEVELOPMENTAL STAGE: UP-REGULATED IN LATE STAGE MINERALIZING CULTURES IN TESTIS, EXPRESSION IS HIGHEST BETWEEN STAGES I AND LOWN-REGULATED IN LATE STAGES I AND VII WHEN MATURING SPERMATIDS REMAIN BURIED WITHIN THE SERTOLI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Mauro L.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          protein search, using sw model
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          March 27, 2003, 15:54:52; Search time 5.42105 Seconds (without alignments) 221.222 Million cell updates/sec

French

The present sequence is derived from a human intestinal carboxylesterase (iCE) polypeptide. iCE induces specific-specific cytotoxic T lymphocytes

polypeptide. iCE induces specific-specific cytotoxic T lymphocytes and secretion by these CTL of cytotoxic factors, e.g. leukin-2, interferon gamma and tumour necrosis factor. iCE

Sequence

9 AA;

Length

9

polypeptides and polynucleotides are used for treating cancer, by in vivo or in vitro immunisation, particularly solid cancers and most especially hepatocarcinoma or adenocarcinoma of colon and kidney. They are also used to stimulate the immune system, and to increase, in culture, the production of associated associated CTL, for reinjection, and/or to induce secretion of cytotoxic factors from CTL. Dendritic cells loaded with iCE are used to induce such CTL in cultures.

                                         The present sequence is derived from a human intestinal carboxylesterase (1CE) polypeptide. ICE induces specific specific cytotaxic T lymphocytes (CTL) and secretion by these CTL of cytotoxic factors, e.g. interleukin-2, interferon gamma and tumour necrosis factor. ICE polypeptides and polynucleotides are used for treating cancer, by in vivo or in vitro immunisation, particularly solid cancers and most especially hepatocarcinoma or adenocarcinoma of colon and kidney. They are also used to stimulate the immune system, and to increase, in culture, the production of associated associated CTL, for reinjection, and/or to induce secretion of cytotoxic factors from CTL.                                                                                                                         The present sequence is encoded by the coding region of human intestinal carboxylesterase (ICE) gene. ICE induces specific specific cytotoxic T lymphocytes (CTL) and secretion by these CTL of cytotoxic factors, e.g. interleukin-2, interferon gamma and tumour necrosis factor. ICE polypeptides and polynucleotides are used for treating cancer, by in vivo or in vitro immunisation, particularly solid cancers and most especially hepatocarcinoma or adenocarcinoma of colon and kidney. They are also used to stimulate the immune system, and to increase, in culture, the production of associated associated CTL, for reinjection, and/or to induce secretion of cytotoxic factors from CTL Dendritic cells loaded with iCE are used to induce such CTL in cultures.
                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptides and its encoding nucleic acid derived from intestinal carboxyesterase, useful as immunostimulants for treating cancer -

                                                                                                                                                                                                                                                                                                                                                                                                                                                Alzheimer's disease, infections caused by bacteria, viruses and fungi, ocular disorders such as corneal infection, endocrine disorders such as premature labour and infertility, gastrointestinal disorders such as Crohn's disease, renal disorders such as glomerulonephritis and respiratory disorders such as asthma and pleurisy. The polypeptides can also be used to aid wound healing, to prevent skin aging due to sunburn, to maintain organs before transplantation, to regenerate tissues and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         associated polynucleotides are useful in the diagnosis, treatment and prevention of various types of disorders in e.g. humans, mice, rabbite, goats, horses, cats, dogs, chickens or sheep. A pathological condition can be determined by detecting the presence or absence of a mutation in cardiovascular system antigen polynucleotide. The treatable disorders include autoimmune diseases such as rheumatoid arthritis, hyperproliferative disorders such as neoplasms of the breast or liver, cardiovascular disorders such as cardiac arrest, cerebrovascular disorders such as cardiac arrest, cerebrovascular disorders such as cardiac arrest, system disorders such as cardiovascular disorders such as cardiac arrest, cerebrovascular disorders such as cerebral ischaemia, nervous system disorders such as
                                                                                                                                                                                                                                                                                                                                                                              Note: The sequence data for this patent did not specification, but was obtained in electronic for at ftp.wipo.int/pub/published_pct_sequences.

This is protein can bind to the Vpr protein encoded by the HIV genome. This is used as a cellular target in the method of the invention of identifying antitumour therapeutic candidates. The invention provides a method for arresting the growth of a cell by treatment with a Vpr lentivirus protein or its analogue. Agents that reduce binding of Vpr to a cellular target are useful for treating HIV (human immune deficiency virus) infection or more generally for restoring growth. The antitumour agent identified is useful for treating any type of cancer, since it induces cell stasis (blocks development at the G2 stage) and death. The agents

Alternatively, the agent contacts a cell expressing the vpr protein under conditions where the Vpr protein induces cell stasis in the absence of the agent. Identification of the agent is then observed by blockage of Vpr-induced cell stasis. The method allows the identification of compounds that block Vpr-mediated cell stasis and ultimately cell death. The compounds can thus be used in the treatment of HIV and other lentiviral infections.
                                                                                                                                                      Yeung Liu C,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        lentiviral infections. The method comprises contacting a cellular target of the Vpr protein with the agent to be tested, and assessing the ability of the agent to block interaction of the Vpr protein with the cellular target, where an agent which blocks this interaction is an anti-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This represents the amino acid sequence of the B29-1 protein. This protein can bind to the Vpr protein encoded by the HIV genome. The invention provides a method of identifying an agent for use in treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Chen

The invention relates to novel foetal polypeptides encoded by polynucleotides comprising one of 477 sequences fully defined in the specification. The foetal polynucleotides and polypeptides are useful in the treatment and diagnosis of diseases such as cancers, immune disorders, growth disorders (e.g. osteoporosis), thrombolytic disorders, nervous system disorders and inflammation. The present sequence is a polypeptide encoded by a cDNA assembled using an expressed sequence tag (EST) found to be expressed in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel fetal proteins useful for the treatment and diagnosis of diseases associated with dysfunction of the protein e.g. cancers, immune disorders, growth disorders, thrombolytic disorders, nervous system disorders and inflammation -

Novel fetal proteins useful for the treatment and diagnosis of diseases associated with dysfunction of the protein e.g. cancers, immune disorders, growth disorders, thrombolytic disorders, nervous system disorders and inflammation -

Example 4; Page 600-601; 715pp; English.

The invention relates to novel foetal polypeptides encoded by polynucleotides comprising one of 477 sequences fully defined 'n the
